GDrive Folder: https://drive.google.com/drive/folders/1plvfq7C7iA1rEZCnVqzNF48tM0uSq1Tt?usp=drive_link
(with checkpoints, but no mimic iii dataset)

1 Introduction

Clinical notes represent invaluable resources encapsulating a patient's health journey, offering vital insights for clinical decision-making. Despite their significance, current machine learning models frequently overlook the intricate sequential and temporal patterns embedded within these notes, leading to predictions that may not accurately reflect a patient's true clinical status. This oversight underscores the necessity for novel approaches capable of effectively integrating both sequential and temporal information from clinical notes to enhance predictive accuracy and facilitate more informed clinical decisions.

Time-Aware Transformer-based Network for Clinical Notes Series Prediction [1] proposed a novel hierarchical model structure, FTL-Trans, to overcome the aforementioned challenges by leveraging both the time and multi-level sequential information inherent in clinical notes. FTL-Trans consists of four successive layers: (1) Chunk Content Embedding Layer encodes each text chunk into an embedding, (2) Position-Enhanced Chunk Embedding Layer enriches the embedding with local and global position embedding, (3) Time-Aware Layer implements Flexible Time-aware LSTM and (4) Classification Layer generates the prediction.

Zhang et al. [1] showed that FTL-Trans consistently outperforms other state-of-the-art transformer-based architectures in their cohort of the MIMIC-III dataset. In our project, we will reproduce the main experiments and validate the efficacy of FTL-Trans in handling clinical notes and predicting healthcare tasks.

2 Methodology

- Chunk Content Embedding Layer
  - The Chunk Content Embedding Layer utilizes ClinicalBERT [3], a variation of BERT model pre-trained on medical text, to encode the textual content of each chunk within a patient's notes.
- Position-Enhanced Chunk Embedding Layer
  - The Position-Enhanced Chunk Embedding Layer combines chunk content embedding with global and local position embeddings to form a unified representation. This embed-

ding incorporates positional information about the note and chunk positions, enhancing the model's understanding of sequential structure.

- Time-Aware Layer
  - The time-aware layer, consisting of the Flexible T-LSTM (FT-LSTM), an extension of the T-LSTM model [2], is designed for capturing the temporal information in the clinical note sequences to reflect the change of temporal importance of clinical events over time. Compared to vanilla LSTM, FT-LSTM uses a flexible and universal decay function applied to short-term memory.
- Classification Layer
  - The classification layer is simply a linear layer with sigmoid activation.

2.1 Data

- MIMIC-III
  - We use MIMIC-III (Medical Information Mart for Intensive Care III) dataset for validation. MIMIC-III is comprised of de-identified health data associated with over 40,000 patients who stayed in intensive care units of the Beth Israel Deaconess Medical Center in Boston, MA, between 2001 and 2012. We perform experiment on two tasks in-hospital mortality prediction and 30-day readmission prediction.
- Cohort
  - 30-day Readmission Prediction: Targeted patients re-admitted without scheduled appointments within 30 days following a prior discharge. The aim is to predict the likelihood of unplanned readmission. Three datasets are used to predict readmit.
    - Discharge summaries may contain information like a patient's discharge condition, procedures, treatments, and significant findings. This means discharge summaries should have predictive value for hospital readmission.
    - Clinical Notes in the early stages of a patient's admission are relevant to readmission prediction as well. We conduct 2 experiments to test model performance given notes up to 24–48h or 48–72h of a patient's admission.
    - All Notes.

3 Scope of Reproducibility:

In examining the code of the repo associated with [1]: https://github.com/zdy93/FTL-Trans/tree/master, we observed multiple implementation and conceptual issues. In addition, when performing the experiment with the provided code, the model will simply not learn anything. While some of the implementation issues can be fixed, some conceptual issues make it very difficult for the approach to work properly.

Therefore, we provide our analysis on the issues and choose to build a similar hierachical models. The detailed analysis is in Model section. ## Ablation Study Using Existing Code: Time Decaying We perform experiment usin the original code from https://github.com/zdy93/FTL-Trans/tree/master and compared it with a baseline when we force the time difference (input to time decay function) to be 1. This is meant to be an ablation study to validate our claim that the design of time decay is problematic in [1]. ## Reproduction of Flat Models baseline - ClinicalBERT, BERT We perform the experiments validating the performance of the baseline flat models including ClinicalBERT and BERT. This also helps our own future implementation of hierachical model since they form the basis of the hierachy.

We use python 3.10 for our experiment. (Although other version will likely work just fine)

[ ]:
```
!python3 --version
```

```
Python 3.10.12
```

We use google colab to run our experiment. We mainly need the the following packages:

[ ]:
```
!pip3 freeze | grep transformer
!pip3 freeze | grep torch
!pip3 freeze | grep matplotlib
!pip3 freeze | grep pandas
!pip3 freeze | grep numpy
```

```
transformers==4.40.1
torch @ https://download.pytorch.org/whl/cu121/torch-2.2.1%2Bcu121-cp310-cp310-

     os.chdir(path)
```

```
Mounted at /content/drive
```

4 Data Preprocessing

The following script expects MIMIC-III unzipped csv data located in ./DATA/

The scrip will generate three datasets of readmission prediction. At current stage, we have included statistical analysis and experiments on the discharge summary dataset as described above.

We use the admission and note events table from the MIMIC-III dataset. https://physionet.org/content/mimiciii/1.4/

```
[ ]: ## We collect the data from MIMIC III dataset. https://physionet.org/content/
      ↪mimiciii/1.4/
     df_adm = pd.read_csv('DATA/ADMISSIONS.csv')
     df_notes = pd.read_csv('DATA/NOTEEVENTS.csv')
```

```
<ipython-input-4-ac212e6e6af4>:3: DtypeWarning: Columns (4,5) have mixed types.
Specify dtype option on import or set low_memory=False.
  df_notes = pd.read_csv('DATA/NOTEEVENTS.csv')
```

Some analysis on the raw MIMIC-III data:

```
[ ]: print('The ADMISSIONS table has %d patients with %d admissions' %␣
      ↪(df_adm['SUBJECT_ID'].nunique(),df_adm['HADM_ID'].nunique()))
```

```
The ADMISSIONS table has 46520 patients with 58976 admissions
```

```
[ ]: print('The NOTEEVENTS table has %d notes with %d categories' %␣
      ↪(df_notes['ROW_ID'].nunique(),df_notes['CATEGORY'].nunique()))
```

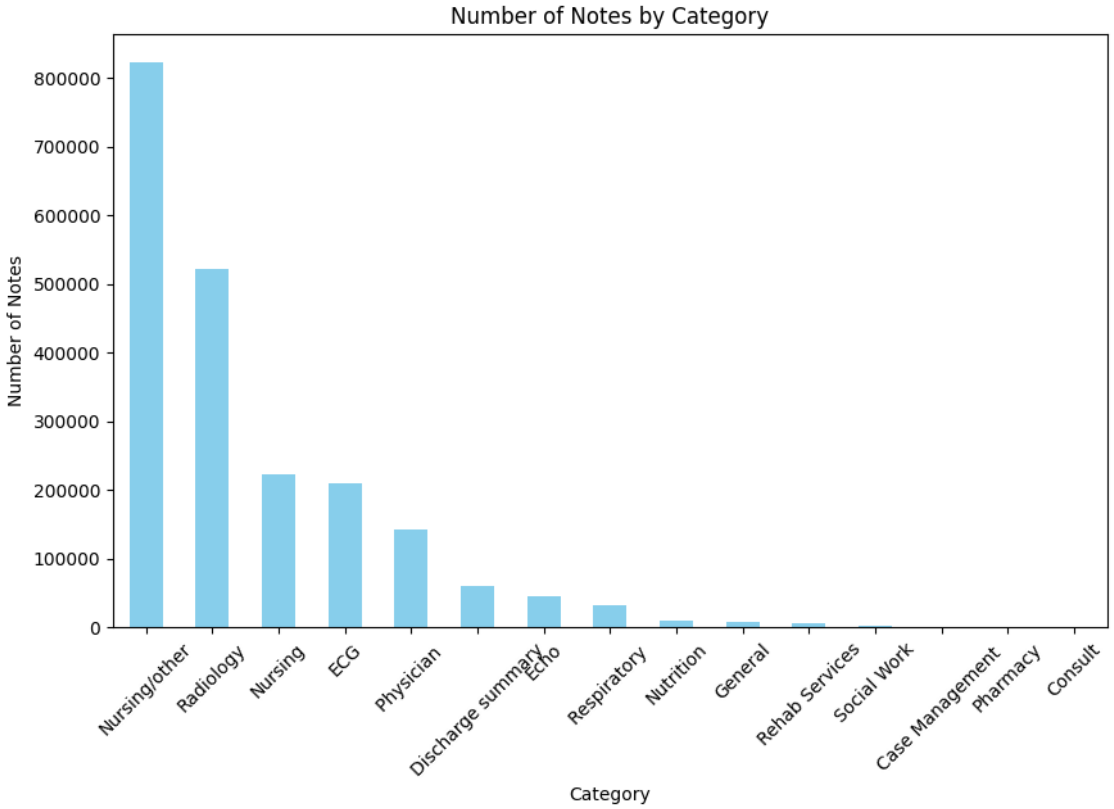
```
The NOTEEVENTS table has 2083180 notes with 15 categories
```

```
[ ]: # Count the occurrences of each category
     category_counts = df_notes['CATEGORY'].value_counts()

     # Sort the counts in descending order
     category_counts = category_counts.sort_values(ascending=False)

     # Plotting number of notes under each category
     plt.figure(figsize=(10, 6))  # Adjust the size as necessary
     category_counts.plot(kind='bar', color='skyblue')  # You can change the color
```

```
plt.title('Number of Notes by Category')
plt.xlabel('Category')
plt.ylabel('Number of Notes')
plt.xticks(rotation=45)  # Rotates the category names for better visibility
plt.show()
```



We begin the definition of functions used for data processing. In summary, main processes we perform include the following: 1. **Train-val-test** split with a ratio of 8:1:1 2. **Label balancing.** Since the number of negative samples are much larger than positive samples. We choose all the positive samples, and sample the same number of the negative samples from the negative sample pool. 3. **Text formatting.** E.g. removing of some de-identified buckets.

[ ]:
```
## Data Process

### Text Cleaning
def preprocess1(x):
    y=re.sub('\\[(.*?)\\]','',x) #remove de-identified brackets
    y=re.sub('[0-9]+\.','',y) #remove 1.2. since the segmenter segments based␣
 ↪on this
    y=re.sub('dr\.','doctor',y)
    y=re.sub('m\.d\.','md',y)
```

```
    y=re.sub('admission date:','',y)
    y=re.sub('discharge date:','',y)
    y=re.sub('--|__|==','',y)
    return y

### Split into Chunks
def preprocessing(df_less_n):
    df_less_n['TEXT']=df_less_n['TEXT'].fillna(' ')
    df_less_n['TEXT']=df_less_n['TEXT'].str.replace('\n',' ')
    df_less_n['TEXT']=df_less_n['TEXT'].str.replace('\r',' ')
    df_less_n['TEXT']=df_less_n['TEXT'].apply(str.strip)
    df_less_n['TEXT']=df_less_n['TEXT'].str.lower()

    df_less_n['TEXT']=df_less_n['TEXT'].apply(lambda x: preprocess1(x))

    #to get 318 words chunks for readmission tasks
    df_len = len(df_less_n)
    want=pd.DataFrame({'ID':[],'TEXT':[],'Label':[]})
    for i in tqdm(range(df_len)):
        x=df_less_n.TEXT.iloc[i].split()
        n=int(len(x)/318)
        for j in range(n):
            new_row = pd.DataFrame({
                      'TEXT': [' '.join(x[j*318:(j+1)*318])],
                      'Label': [df_less_n.OUTPUT_LABEL.iloc[i]],
                      'ID': [df_less_n.HADM_ID.iloc[i]]
                      })
            want = pd.concat([want, new_row], ignore_index=True)
        if len(x)%318>10:
            new_row = pd.DataFrame({
                      'TEXT': [' '.join(x[-(len(x)%318):])],
                      'Label': [df_less_n.OUTPUT_LABEL.iloc[i]],
                      'ID': [df_less_n.HADM_ID.iloc[i]]
                      })
            want = pd.concat([want, new_row], ignore_index=True)

    return want

4.1 Dataset Generation for Hierachical BERT

The Hierachical BERT needs all discharge summaries for a single admission to perform prediction making its datase different from flat model such as ClinicalBERT. The dataset can be generated by running https://github.com/yitzhao/CS598_FTL_Trans/blob/main/mimic_json.py after modifying the _DIR to specify output location

5 Model and Analysis

We include the following implementation from the repo of the paper [1]. We add our own annotation for the structure to be understandable. Yet, during our study of the model, we found multiples issues. We summarize them as the following:

Poor Positional Embedding Design The embedding is a learned embedding which is used in vision transformer. However, vision transformer has a fixed number of patches for each image to apply the position embedding; therefore, the positional embedding of vision transformer at each position is equally and fully trained. However, when used for clinical notes and chunks of clinical notes. The number of positional embedding can vary largely such that the earlier positional embedding is trained a lot more than the later one. For patients with longer history, the positional embedding might barely be trained or not trained at all.

Shared chunk position across different notes The chunk positional embedding is doesn't restart from 0 for each note. Therefore, It loses some ability such as representing the begining chunk of each note.

Reusing weights between forward pass and backward pass in Bi-LSTM The implementation of FTLSTM uses the exact same parameter for the forward LSTM and backward LSTM. Consider that the forward and backward pass can include very differnet features, we believe this is a major flaw and can significantly hurt performance.

Time Decay Design As implemented in map_elapse_time, the time decay is meant to help model learn the time difference between note chunks. However, since each note is splited into many chunk, the time difference t is mostly 0. Making the time difference very sparse and lack of information. In addition, these time difference also appear in the demominator of in the time decay function which further enlarges the problem.

import torch
from torch import nn
from torch.nn import init, Parameter
from torch.nn import CrossEntropyLoss, BCELoss, BCEWithLogitsLoss
import numpy as np

'''
The PatientLevelEmbedding provides embedding for chunk _id, note_id, and␣
 ↪combine it with representation of BERT for each chunk of note.
The embedding is a learned embedding, similar to vision transformer.

We provide a forward example from the training set:

new_note_ids (Serves as positional embedding for notes):
tensor([1, 1, 0, 0, 0])
Similar to the segment_id of BERT, this positional embedding separate different␣
 ↪notes. In this example, there are two notes
with position id 0 and 1.

new_chunk_ids (Serves as positional embedding for chunks):
tensor([4, 3, 2, 1, 0])
From the implementation from the author[1], this is simply a reserved python␣
 ↪range function output since the chunk is ordered.
However, we believe this is problematic and chunk id should restart from 0 for␣
 ↪each new note. ([1, 0, 2, 1, 0]) in this case.

inputs (Bert Representation):
tensor of shape (5, 768)

6 Training

6.1 Computational Requirements

Due to the size of our cohort being small. Our training will generally take around 1 hr and half on a budget GPU such as Quadro RTX 5000 or T4 for 3 epoches (30 minutes per epoch) training on a single model. In total, we ran 6 experiments.

We incorporated the training of BERT and ClinicalBERT with huggingface model as a baseline for our experiments.

6.2 Hyperparameters

Some weights of BertForSequenceClassification were not initialized from the
model checkpoint at emilyalsentzer/Bio_ClinicalBERT and are newly initialized:
['classifier.bias', 'classifier.weight']
You should probably TRAIN this model on a down-stream task to be able to use it
for predictions and inference.

6.2.2 Hierachical Model Experiments using All Notes Cohort

For Hierachical Model, we used a different cohort compared to flat models

LSTM readmission prediction (no time info) The LSTM model serves as a baseline model in hierachical models, which does not include time info. We also compare its results with FTL-Trans as a ablation study to show the effect of time info.

```
[ ]: ### Follow the instructions in preprocessing_FTL_Trans.ipynb to generate DATA␣
      ↪FILE ./DATA/readmission/, which contains train.csv, val.csv and test.csv
     ### Run the code below to obtain the evaluation results
     !pip install pytorch_transformers
     !pip install pytorch_pretrained_bert
     !pip install dotmap

     !python3 run_clbert_lstm.py --data_dir ./DATA/readmission/ --train_data train.
      ↪csv --val_data val.csv --test_data test.csv --log_path ./log_readmission.txt␣
      ↪--bert_model ./pretraining/ --embed_mode all --task_name LSTM_Prediction␣
      ↪--max_seq_length 128 --train_batch_size 32 --eval_batch_size 1␣
      ↪--learning_rate 2e-5 --num_train_epochs 3 --warmup_proportion 0.1␣
      ↪--max_chunk_num 32 --seed 42 --gradient_accumulation_steps 1 --output_dir ./
      ↪exp_LSTM --save_model
```

FTL-Trans readmission prediction (slightly adjust time decay function) As the FTL-Trans above shows a poor result (accuracy = 0.5), we investigated the root cause, which is the flexible time decaying function. The explanation is covered in details in the result section.

For this experiment, we set the delta t = 1 as a constant rather than the intervals between two adjacent chunks.

7 Evaluation

Accuracy

AUROC (Area under the Receiver Operating Characteristic Curve): The area beneath the curve illustrating the true positive rate versus the false positive rate. #### AUPRC (Area under the Precision-Recall Curve): The area beneath the plot of precision against recall, depicting the trade-off between the two metrics. #### RP80 (Recall at Precision of 80%): Represents the recall achieved when precision reaches 80%, especially significant in reducing false positives for readmission prediction.

```

8 Results

We report our results with our baselines BERT and ClinicalBERT as the following (in case the experiment excution above can't be finished on time)

We also report partial results running using FLT-Trans repos. However, we haven't finished all metrics, so we report with limited results.

8.0.1 Result 1: Bert v.s. ClinicalBert

Beyond the original paper, we conduct experiments of Bert v.s. ClinicalBert on Readmission Prediction using Discharge Summaries.

Our experiments shows

```
Bert:
{'eval_accuracy': 0.6072477962781586,
  'auc_score': 0.6502302314565969,
  'auprc_score': 0.6816921470562338,
  'RP80': 0.12758620689655173}

ClinicalBert:
{'eval_accuracy': 0.6199804113614104,
'auc_score': 0.6390223553579609,
'auprc_score': 0.6624124970453183,
'RP80': 0.027586206896551724}
```

The ClinicalBert outperforms Bert in terms of eval_accuracy, showing that ClinicalBert has better performance on health related data compared to Bert.

8.0.2 Result 2: Replicate FTL-Trans

To reproduce the result of original paper, we conduct experiments of FTL-Trans using All Notes. However, we get results:

```
Test Patient Level Accuracy: 0.503957783641161
Test Patient Level F1 Score: 0.6701754385964912
Test Patient Level Precision: 0.503957783641161
Test Patient Level Recall: 1.0
```

```
Test Patient Level AUC: 0.5
Test Patient Level Matthew's correlation coefficient: 0.0
Test Patient Level AUPR: 0.7519788918205805
```

The Accuracy is only ~0.5, showing that the model barely outperforms a random guess.

8.0.3 Result 3: (Ablation Study 1) Adjust FTL-Trans

Upon Investigation, we found that this is due to inappropriate use of time decay function.
The paper divides each patient's note into multiple chunks, with the time for each chunk being the same. The delta t in the time decay function is the time interval between adjacent chunks. Consequently, we will inevitably get many zeros. These zeros, in the g(delta t) function of the FTL model, will appear in the denominator, leading to incorrect results.
To test our hypothesis, we run another experiment that simply set delta t = 1 as a constant, which yields a better result.

```
Test Patient Level Accuracy: 0.5883905013192612
Test Patient Level F1 Score: 0.5894736842105263
Test Patient Level Precision: 0.5925925925925926
Test Patient Level Recall: 0.5863874345549738
Test Patient Level AUC: 0.5945750250640526
Test Patient Level Matthew's correlation coefficient: 0.17680804262056563
Test Patient Level AUPR: 0.5529735214178602
```

We could see Accuracy increases from 0.5 to 0.588 by only setting delta t = 1. It seems that by adjusting the delta t in an appropriate manner, we could see FTL-Trans outperforms ClinicalBert.

8.0.4 Result 4: (Ablation Study 2) LSTM v.s. FTL-Trans

The only difference between FTL-Trans and LSTM is the inclusion of time info. Therefore, we want to test if time info helps FTL-Trans outperforms LSTM. The LSTM shows result:

```
Test Patient Level Accuracy: 0.5775
Test Patient Level F1 Score: 0.6442105263157896
Test Patient Level Precision: 0.5563636363636364
Test Patient Level Recall: 0.765
Test Patient Level AUC: 0.6080749999999999
Test Patient Level Matthew's correlation coefficient: 0.16720156589088403
Test Patient Level AUPR: 0.5825588122450577
```

By comparing LSTM's accuracy v.s. FTL-Trans (adjusted version), we could see FTL-Trans (accuracy=0.588) does outperform LSTM (accuracy=0.577), suggesting that time info is valuable to readmission prediction.

8.0.5 Conclusion

From the results above we observe a mild improvement on accuracy from BERT to ClinicalBERT. The RP80, however, is much different between two models. We think this is due to the representation formed by clinical BERT and the prediciton probability is more expressive than BERT. We believe this gives more room for additional layers.

The experiment between the FTL-Trans and an ablation study (for which we set override time delta) to be 1 validate our doubts on the flexible time decaying introduced in FTL-Trans as the model failed to handle the actual time delta and failed to learn any meaningful results. Also, in comparison with flat model, we also see significantly lower accuracy with FTL-Trans which is likely caused by poor implementation which we aim to fix in the future experiments.

Moreover, the ablation study of comparing LSTM and FTL-Trans shows that the time info is valuable to the prediction task. Therefore, we believe that by appropriately handle flexible time decaying introduced in FTL-Trans, we can get better predictions.

9 Discussion

9.0.1 Reproducibility

During our reproduction, we met two difficulties. First, the author did not publish how he preprocessed the data. The instructions are pretty vague. In fact, we refer to another paper's repo (https://github.com/kexinhuang12345/clinicalBERT/tree/master) to figure out the preprocessing steps. We also saw other people raised same issue in the repo. The second difficulty is the time decay function we discussed above.

Overall, due to the issues we mentioned in result section, we do not think the result can be reproduced. Even we fixing the implementation issues, the flexible time function introduced in FTL-Trans[1] will not work properly with the actual time different (which is 0 for most of the time).

9.0.2 Recommendations

Corresponding to our two challenges, we think 2 things are important: 1. Giving clear instructions of reproducity, including data preprocessing 2. Before pushing codes to github, make sure the results is reproducible
